## 1.0 PROJECT OVERVIEW

### 1.1. PROJECT DESCRIPTION & LOCATION

The proposed site for the Port of Hueneme temporary vehicle storage area is located at the Southeast corner of Perkins Rd. and W. Hueneme Rd. in Oxnard, CA. Proposed improvements consist of: grubbing, regrading, and installing a gravel surface to create a temporary storage area for approximately 6,000 vehicles that will be offloaded from the Port of Hueneme. There will be a small increase in impervious area of less than one percent of the 33.74 acre site. See Appendix A for the Location Map. This project will be constructed with a Special Use Permit for a temporary 5 year term through the City of Oxnard (City).

### 1.2. SITE CONDITIONS

The existing and proposed site conditions are shown in the grading plan exhibit in Appendix A.

#### 1.2.1. Existing Drainage Patterns

Currently, the whole site is undeveloped but has been tilled in the past with portions of the site previously graded and used for temporary parking. The site is relatively flat with a minimal slope ranging from 0.2% to 0.6% across the site. During storm events, the water either infiltrates into the ground, ponds in place, or drains towards the Southeast into an existing storm drain outlet that runs under the railroad on the South side of the lot. Any runoff leaving the site from this outlet sheet flows onto gravel and vegetation approximately 140 from the Oxnard Industrial Drain, now called the Ormond Lagoon Waterway, that is designed for a 100 year storm event. The storm drain outlet consists of a wing wall and three 12-inch CMP pipes. The outlet is currently filled with debris and sediment. The images below show the current condition of the outlet structure. The pipes are approximately 15 feet long and sloped at 6% to the South.

Figure 1- Existing Culvert Inlet

Figure 2- Existing Culvert Outlet

### 1.2.2. Proposed Drainage Patterns

The proposed conditions will drain the site towards the storm drain outlet at an average design slope of 0.5%. The storage area will be covered with approximately one inch of gravel which will allow the water to infiltrate into the ground at the same rate as the existing conditions. There are proposed French drains located at the South of the site. The French drains will be sloped at 0.2% and lead to a concrete rectangular channel which flows toward the existing storm drain outlet. Historical drainage patterns are maintained. The outlets will be cleaned of debris and maintained after storm events.

## 1.3. REPORT OBJECTIVE

The intent of this report is to provide analysis of the proposed drainage facilities for the Port of Hueneme temporary vehicle storage area and to demonstrate the site is designed in accordance with City of Oxnard design standards and sound engineering principles.

## 2.0 DESIGN METHODOLOGY

### 2.1. EXISTING ON-SITE FLOWS

Storm water flows in the existing condition were calculated using the City's Cook's Method and Ventura County's (County's) method. The entire site was analyzed as one area since there is only one outlet for the site. The storm water conditions were modeled with the Tc Calculator and VCRat software from Ventura County. The hydrographs were created using Hydraflow Hydrograph software. The City's Cook's Method was used to calculate peak flows to size channels and drains while analyzing the culverts. The County's method was used to calculate volume for detention analysis. The analysis showing the calculations for the existing peak flows can be found in Appendix B, and is summarized in the table below.

Table 1-Existing Condition  
Modified Cook's Storm Water Flows

Existing Onsite Drainage			
Area (ac)	Q10 (cfs)	Q50 (cfs)	Q100 (cfs)
33.7	23.0	39.0	46.0

### 2.2. PROPOSED ON-SITE FLOWS

The proposed on-site flows are assumed to be the same because the improvements hold lined grade. The only impervious area added is a rectangular channel to aid in conveying the water off site and the guard shack. The total impervious area is 2,624 square feet, 0.18 percent of the total site. Two sub-areas were calculated using the City's Cook's Method to size the French drains (Subarea A) and channel (Subareas A and B) leading to the outlet. The calculated runoffs are summarized in the table below. The County's Method was used to analyze detention.

Table 2-Proposed Condition  
Modified Cook's Storm Water Flows

Developed Onsite Drainage				
Drainage Area	Area (ac)	Q10 (cfs)	Q50 (cfs)	Q100 (cfs)
A	2.7	2.0	3.5	4.0
A+B	10.1	7.6	13.0	15.2
Total Site	33.7	23.0	39.0	46.0

The French drains were sized using Flow Master, resulting in two 12 inch perforated PVC pipes spaced with a 12 inch clearance and a slope of 0.25%. The channel cross section was sized using Flow Master. The rectangular channel for Subarea B were sized with a slope of 0.2%, width of three feet, and a height of one and a half feet. The calculations for the peak flows, drain sizing, and channel sizing can be found in Appendix B.

### 3.0 Q100 PAD PROTECTION

In the proposed development, the water will periodically pond near the existing storm drainage outlet. The extent of ponding is marked on the grading plan exhibit in Appendix A. Cars will not be stored in this area. Cars will be protected from flooding up to the 100 year storm event, exceeding Oxnard's hydrology requirements. According to FEMA mapping dated 2010, the site is in a 500 year flood zone. The FEMA map is located in Appendix E. This project does not require any further action for the 500 year storm event. According to the Industrial Drain Channel Improvements Study dated 2006, a portion of the site is flooded in the 100 year storm event at a water level up to 0.5 feet. Due to the potential for water flow onto the site from flooding of the Ormond Lagoon Waterway, an extra volume of 34,124 cubic feet of storage was included in detention to accommodate the additional water from the overflow of the Ormond Lagoon Waterway (Oxnard Industrial Drain).

### 4.0 DETENTION

#### 4.1. DETENTION REQUIREMENTS

Runoff from the site will flow into the existing storm drain outlet. The storm drain outlet consists of a wing wall and three 12-inch CMP culverts that outlet to the Oxnard Industrial Drain. Detention is assumed based on the high peak flows and the limited size of the outlets. The detention needed will be calculated with the Hydraflow Hydrograph software.

The proposed site drains to the low spot near the existing outlet. Since the runoff will pond around the outlet, the area was analyzed as a detention basin. The volume and peak flow for the detention analysis was calculated with the County's method. The detention basin was sized based on the 100 year storm event, which resulted in the peak flows of 28 cfs into the basin and 2.4 cfs discharged through the culvert. The required detention volume for the site was obtained through Hydraflow Hydrographs using hydrograph outputs from VCRat software. A time of concentration of 28 minutes was used based on the calculation done in the Ventura County (County) Tc Calculator. The ponding

area has the capacity to store 98,109 cubic feet of water. For the 100 year storm event, the water volume required for detention is 63,985 cubic feet, which would fully drain in 13 hours. The detention basin was also analyzed for the 10 and 50 year storm event. These calculations can be found in Appendix C. The extra 34,124 cubic feet of storage is for the additional water from the overflowing of the Ormond Lagoon Waterway (Oxnard Industrial Drain). The water level in detention basin for the 100 year storm event is 0.43 feet high and flows into the outlet. The outlet does not become pressurized and the water level after it exits the detention basin is 0.11 feet high. The cross section of the detention basin with flow lines is shown in the figure below. The outlet was analyzed with the Federal Highway Administration's HY-8 culvert software. The outlet is inlet controlled and has a peak discharge of 2.4 cfs for the 100 year peak flow. The summary report can be found in Appendix C.

Figure 3-Cross Section of Detention Area

## 5.0 MS4 PERMIT COMPLIANCE

The proposed development is not subject to the MS4 Permit requirements because it does not fall into any of the categories listed in Part 4 E.II.1. of the permit. The temporary vehicle storage area contains less than 5,000 SF of impervious area on the site and cars will be parked at the site for temporary storage. Vehicles will be offloaded and on loaded onto the site for extended periods of time. The proposed development will not increase the storm runoff.

The ground will be compacted to a maximum of 80-85% of relative compaction. The historical pictures of the site show that a portion of the site has been compacted over the past few years, which are included in Appendix D.

## 6.0 CONCLUSIONS

Design of the on-site storm drain system meets the City of Oxnard requirements for detention. The requirements for pad protection and storm water treatment do not apply for this site. The storm drain system is designed to handle a 100 year storm event. Storm water runoff will be detained when necessary prior to being routed to the Ormond Lagoon Waterway (Oxnard Industrial Drain). Calculations included in this report support the basis for the design, ensuring that all requirements put forth by the City of Oxnard are met.

## Hyd. No. 2

&lt;no description&gt;

Hydrograph type = Reservoir  
 Storm frequency = 10 yrs  
 Time interval = 1 min  
 Inflow hyd. No. = 1 - <no description>  
 Reservoir name = Ponding

Peak discharge = 0.489 cfs  
 Time to peak = 1182 min  
 Hyd. volume = 18,791 cuft  
 Max. Elevation = 9.59 ft  
 Max. Storage = 27,194 cuft

Storage Indication method used.

SPECIAL FLOOD HAZARD AREAS		Without Base Flood Elevation (BFE) Zone A, V, A99
		With BFE or Depth Zone AE, AO, AH, VE, AR
		Regulatory Floodway
OTHER AREAS OF FLOOD HAZARD		0.2% Annual Chance Flood Hazard, Areas of 1% annual chance flood with average depth less than one foot or with drainage areas of less than one square mile Zone X
		Future Conditions 1% Annual Chance Flood Hazard Zone X
		Area with Reduced Flood Risk due to Levee. See Notes. Zone X
		Area with Flood Risk due to Levee Zone D
OTHER AREAS		NO SCREEN Area of Minimal Flood Hazard Zone X
		Effective LOMRs
		Area of Undetermined Flood Hazard Zone D
GENERAL STRUCTURES		Channel, Culvert, or Storm Sewer
		Levee, Dike, or Floodwall
OTHER FEATURES		20.2 Cross Sections with 1% Annual Chance Water Surface Elevation
		17.5
		Coastal Transect
		Base Flood Elevation Line (BFE)
		Limit of Study
		Jurisdiction Boundary
		Coastal Transect Baseline
MAP PANELS		Digital Data Available
		No Digital Data Available
		Unmapped

The pin displayed on the map is an approximate point selected by the user and does not represent an authoritative property location.

This map complies with FEMA's standards for the use of digital flood maps if it is not void as described below. The basemap shown complies with FEMA's basemap accuracy standards

The flood hazard information is derived directly from the authoritative NFHL web services provided by FEMA. This map was exported on 3/19/2019 at 12:42:41 PM and does not reflect changes or amendments subsequent to this date and time. The NFHL and effective information may change or become superseded by new data over time.

This map image is void if the one or more of the following map elements do not appear: basemap imagery, flood zone labels, legend, scale bar, map creation date, community identifiers, FIRM panel number, and FIRM effective date. Map images for unmapped and unmodernized areas cannot be used for regulatory purposes.
